

Design goal: 20 real projects, one exposed harness per project

Test unit: $U = (P, V, H)$ Campaign: $C = (F, S, U, T)$

Program / revision / harness | Fuzzer / sanitizer / unit / time budget

C1 Native programs and historical faults

Preserve historical program context
Trace candidate fault provenance

C2 Scoring entries per test unit

Count witnessed first-fault fingerprints
Interpret within a fixed configuration

C3 Input-level verification materials

Inputs and reports: physical witnesses
Fingerprints: operational scoring identities

C4 Fixed build and runtime environments

Record sources, binaries and dependencies
Audit image and replay evidence

Environment E is linked separately; repetitions R belong to the experiment design.

All four criteria require evidence; quantity alone does not establish evaluation efficiency.
